JAVA SERIES: STRINGS & SPECIAL CHARACTERS

/> String Concatenation

Combining strings into a single sequence. Standard operator: +.

```
String firstName = "John";  
String lastName = "Doe";  
System.out.println(firstName + " " + lastName); // Outputs "John Doe"
```

/> The concat() Method

```
String a = "Java ";  
String b = "is ";  
String result = a.concat(b).concat("fun!");  
System.out.println(result); // Outputs "Java is fun!"
```

/> Numbers vs Strings

```
// Arithmetic (Numeric Context)  
int x = 10; int y = 20;  
System.out.println(x + y); // 30  
  
// Concatenation (String Context)  
String s1 = "10"; String s2 = "20";  
System.out.println(s1 + s2); // "1020"
```

/> Escape Sequences

Escape	Result	Description
<code>\'</code>	<code>'</code>	Single quote
<code>\"</code>	<code>"</code>	Double quote
<code>\\</code>	<code>\</code>	Backslash
<code>\n</code>	[New Line]	Next line break

/> CodeHive Summary

- Operator `+` triggers concatenation if either side is a String.
- Use `\n` for formatting outputs with line breaks.
- Escape sequences prevent syntax errors with quotes and symbols.
